

## How to 'future proof' your precision ag buy

The changes witnessed in the precision ag technology field seem to be coming quicker and faster than ever before, making it extremely difficult for a cotton or grain grower to keep across everything when making purchasing decisions.

Precision ag company mergers, new product releases, same brand equipment being superseded by incompatible new models all create confusion for the end user on what to buy. They need to know who they can talk to that actually understands the pros and cons of all that is available and not just what they have on the shelf to sell.

Recently Agline Distributors launched its new precision ag product range to capitalise on the extensive experience of its staff and dealer network by developing an interoperable range of products. Its dealer network is well known in the cotton industry for its supply of the high performance autosteer Beeline Technologies equipment, the company's global market penetration via AGCO and now Hemisphere's Outback range. But precision ag is bigger than just auto steering and to broaden its product range was a logical step for Agline Distributors to better meet growers increasingly sophisticated and precise farming practices.

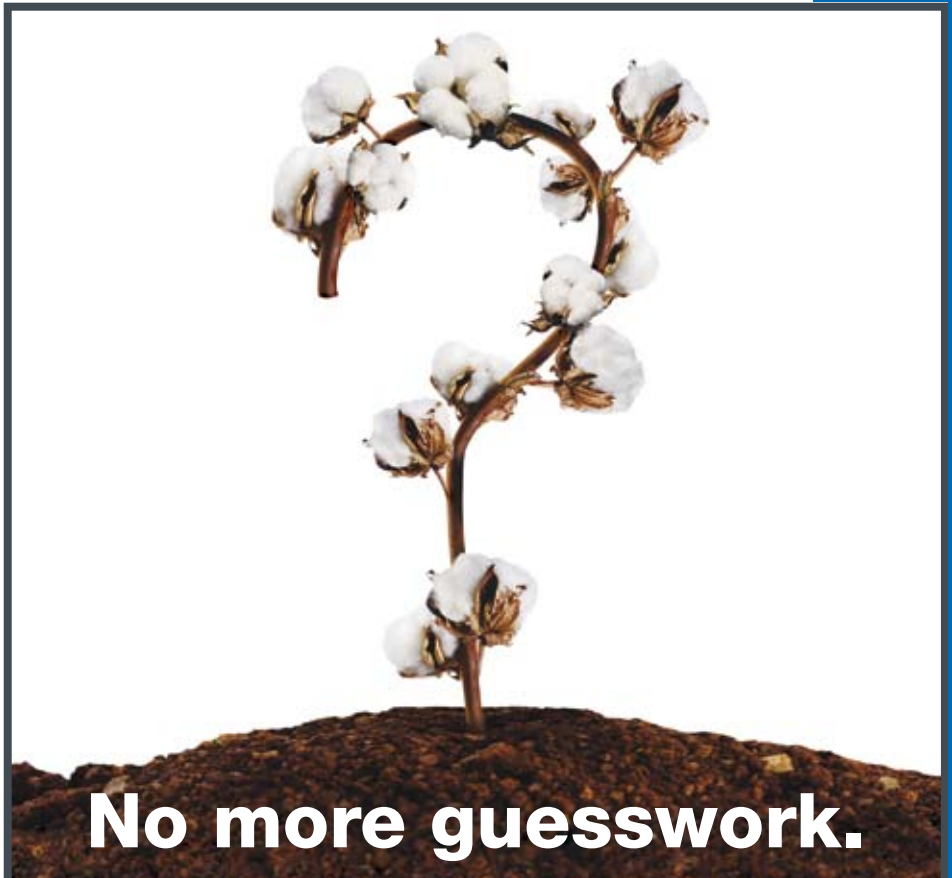

The new 2008 precision ag product range includes;

- Farmworks Farm Management and Mapping Software;
- Beeline Technologies;
- Leica Geosystems MojoRTK;
- Raven;
- Rinex;
- DICKEY-john;
- Bio Series Precision Planters; and,
- Base station towers, repeaters, radios and networking.

A key consideration in the development of the new product range was each product had to be compatible with the global agricultural manufacturing ISOBUS standard. This allows locally based Agline dealers to consult with growers and then recommend the combination of features and functions needed to get the job done. Growers have the confidence of knowing that the technology bought today can be built on further in the future. That is what ISOBUS compatible

precision ag technology can deliver to the end user – the ability to buy with confidence today irrespective of what developments the future brings.

**For a brochure pack of the new product range email your mailing address to [felicity@agline.com.au](mailto:felicity@agline.com.au) or call on 0428 537 934.**

## No more guesswork.

**Cotton growers are using the world's most advanced soil moisture technology to understand water dynamics across their crop, improve yields and maximise water efficiency.**

The new generation of AquaSpy water management systems provide a complete understanding of the environment right through the soil profile.

No other soil moisture probe provides data at every 100mm about soil moisture and temperature levels.

A durable, no maintenance modular design and an open and common platform enables plug and play connectivity.

Manual, radio or cellular download options are available for delivering data online or to PC based software.

A growing distributor network means there are AquaSpy dealers located across Australia – and support is just a phone call away.

**AquaSpy - Intelligence in every drop.**
